## Revolver Throttle Installation Suzuki GSX1300R Hayabusa P/N 01-2665

The Revolver installation for the Hayabusa is unique in that the Revolver cables are routed in a different manner from stock. The cables route from the throttle body bell crank on the left, up the frame, and through the space between the left fork leg and the steering head. The throttle is installed with the cables routed over the top of the handlebar, and behind the master cylinder reservoir. All other installation is according to the standard instructions included with the kit. Please refer to the pictures below that illustrate the proper routing.

Cables mounted to the throttle body and routed along the frame.

Route the cables between the fork and the frame.

Cables are in front of the triple clamp and over the bar and master
